

**IN THE CLAIMS**

Please amend the claims as indicated:

- 1        1.        (currently amended) An apparatus for use in a borehole for electrical imaging  
2                during rotary drilling comprising:  
3                (a)        a resistivity sensor having ~~a specified~~ an offset from a wall of the  
4                borehole that is greater than a specified minimum value;  
5                (b)        an orientation sensor making a measurement of a toolface angle of said  
6                apparatus during continued rotation thereof; and  
7                (c)        a device ~~for maintaining~~ which maintains said resistivity sensor at said  
8                ~~specified~~ offset.  
9
- 1        2.        (original) The apparatus of claim 1 wherein said resistivity sensor comprises a  
2                galvanic sensor.  
3
- 1        3.        (currently amended) The apparatus of claim 1 wherein said resistivity sensor is  
2                mounted on a pad.  
3
- 1        4.        (currently amended) The apparatus of claim 1 wherein said resistivity sensor is  
2                mounted on a rib.  
3
- 1        5.        (currently amended) The apparatus of claim 1 wherein said resistivity sensor is

2 mounted on a stabilizer.

3

1 6. (currently amended) The apparatus of claim 1 wherein said resistivity sensor  
2 further comprises

- 3 (i) a current electrode ~~for conveying~~ which conveys a measure current into  
4 said formation through a conducting fluid, and  
5 (ii) at least one guard electrode proximate to said current electrode for  
6 maintaining focusing of said measure current.

7

1 7. (original) The apparatus of claim 6 wherein said at least one guard electrode  
2 focuses said measure current in a direction substantially normal to said borehole  
3 wall.

4

1 8. (original) The apparatus of claim 7 wherein said at least one guard electrode  
2 surrounds said measure electrode and maintains a focusing of said measure  
3 current in a flushed zone of said formation.

4

1 9. (original) The apparatus of claim 7 wherein the at least one guard electrode  
2 comprises a plurality of guard electrodes for altering a depth of investigation of  
3 said resistivity sensor.

4

1 10. (original) The apparatus of claim 6 wherein said at least one guard electrode

2 comprises a plurality of guard electrodes that create substantially spherical  
3 equipotential surfaces  
4

1 11. (currently amended) The apparatus of claim 1 wherein said resistivity sensor  
2 further comprises:

3 (i) a current electrode ~~for conveying~~ which conveys a measure current into  
4 said formation, and

5 (ii) a measure electrode spaced apart from said current electrode,  
6 the apparatus further comprising a processor ~~for determining~~ which determines  
7 from a voltage of said measure electrode and said measure current an indication  
8 of a resistivity of said earth formation.  
9

1 12. (original) The apparatus of claim 8 further comprising monitor electrodes to  
2 support the focusing in the presence of non negligible contact impedances.  
3

1 13. (original) he apparatus of claim 9 further comprising monitor electrodes to  
2 support the focusing in the presence of non negligible contact impedances.  
3

1 14. (original) The apparatus of claim 8 wherein further comprising a pad that  
2 substantially circumscribes said apparatus, said pad carrying said sensor thereon  
3

1 15. (original) The apparatus of claim 14 further comprising monitor electrodes to

2 support the focusing in the presence of non negligible contact impedances.

3

1 16. (currently amended) The apparatus of claim 8 further comprising a controller ~~for~~  
2 ~~maintaining~~ which maintains a substantially constant power consumption by said  
3 electrodes.

4

1 17. (currently amended) The apparatus of claim 12 further comprising a controller ~~for~~  
2 ~~maintaining~~ which maintains a substantially constant power consumption by said  
3 electrodes.

4

1 18. (currently amended) The apparatus of claim 14 further comprising a controller  
2 ~~for maintaining~~ which maintains a substantially constant power consumption by  
3 said electrodes.

4

1 19. (currently amended) The apparatus of claim 14 further comprising a controller ~~for~~  
2 ~~maintaining~~ which maintains a substantially constant power consumption by said  
3 electrodes.

4

1 20. (original) The apparatus of claim 1 wherein said orientation sensor comprises a  
2 magnetometer.

3

1 21. (original) The apparatus of claim 1 wherein said orientation sensor comprises an

2 accelerometer.

3

1 22. (original) The apparatus of claim 1 wherein said device comprises a stabilizer.

2

1 23. (original) The apparatus of claim 1 wherein said device comprises a steerable rib.

2

1 24. (original) The apparatus of claim 1 wherein said borehole is filled with a  
2 substantially nonconducting fluid and wherein said resistivity sensor is  
3 capacitively coupled to said earth formation.

4

1 25. (original) The apparatus of claim 24 wherein said resistivity sensor makes  
2 measurements at a plurality of different frequencies.

3

1 26. (original) The apparatus of claim 1 wherein said borehole includes a substantially  
2 non-conducting fluid therein.

3

1 27. (currently amended)The apparatus of claim 2 wherein said borehole includes a  
2 substantially non-conducting fluid therein and wherein said resistivity sensor  
3 ~~conveys~~ conveys a measure current into said formation using capacitive coupling.

4

1 28. (original) The apparatus of claim 1 wherein said resistivity sensor further  
2 comprises a shielded dipole.

3

1 29. (original) The apparatus of claim 26 wherein said resistivity sensor further  
2 comprises a shielded dipole.

3

1 30. (original) The apparatus of claim 26 wherein said resistivity sensor further  
2 comprises a directionally sensitive induction logging tool.

3

1 31. (original) The apparatus of claim 30 wherein said directionally sensitive induction  
2 logging tool comprises a quadrupole transmitter.

3

1 32. (original) The apparatus of claim 26 wherein said resistivity sensor further  
2 comprises a radio frequency microwave transmitter

3

1 33. (original) The apparatus of claim 26 wherein said resistivity sensor comprises an  
2 induction coil.

3

1 34 (currently amended) A system for use in a borehole for determining a resistivity  
2 parameter during drilling of a borehole in an earth formation comprising:

3 (a) a bottom hole assembly (BHA) including

4 (i) a resistivity subassembly having a resistivity sensor with a  
5 ~~specified~~ an offset from a wall of the borehole that is greater than a  
6 specified minimum value during rotation of the BHA;

- 7 (ii) an orientation sensor on said subassembly ~~for making~~ which makes  
8 a measurement of a toolface angle of said subassembly during  
9 continued rotation thereof; and
- 10 (ii) a device ~~for maintaining~~ which maintains said resistivity sensor at  
11 said ~~specified~~ offset.
- 12 (b) a processor ~~for determining~~ which determines said resistivity parameter  
13 from measurements made by said resistivity sensor;
- 14 (c) a device ~~for drilling~~ which drills said borehole; and
- 15 (d) conveyance device ~~for conveying~~ which conveys said BHA into said  
16 borehole.
- 17
- 1 35. (original) The system of claim 34 wherein said device for drilling said borehole  
2 comprises a drill bit.  
3
- 1 36. (original) The system of claim 34 wherein said conveyance device comprises a  
2 drill string.  
3
- 1 37. (original) The system of claim 34 wherein said processor is part of said BHA.  
2
- 1 38. (currently amended) The system of claim 34 wherein said processor includes a  
2 memory device ~~for storing~~ at least a subset of measurements made by said  
3 resistivity sensor.

4

1 39. (original) The system of claim 34 wherein said resistivity sensor comprises a  
2 galvanic sensor.

3

1 40. (currently amended) The system of claim 39 wherein said sensor further  
2 comprises

3 (i) a current electrode ~~for conveying~~ which conveys a measure current into  
4 said formation through a conducting fluid, and

5 (ii) at least one guard electrode proximate to said current electrode ~~for~~  
6 maintaining which maintains focusing of said measure current.

7

1 41. (original) The system of claim 40 wherein said processor maintains a substantially  
2 constant power consumption by said electrodes.

3

1 42. (original) The system of claim 34 wherein said orientation sensor comprises a  
2 magnetometer.

3

1 43. (original) The system of claim 34 wherein said orientation sensor comprises an  
2 accelerometer.

3

1 44. (original) The system of claim 34 wherein said device comprises a stabilizer.

2

1 45. (original) The system of claim 34 wherein said device comprises a steerable rib.

2

1 46. (original) The system of claim 34 wherein said borehole is filled with a  
2 substantially nonconducting fluid and wherein said resistivity sensor is  
3 capacitively coupled to said earth formation.

4

1 47. (original) The system of claim 46 wherein said resistivity sensor makes  
2 measurements at a plurality of different frequencies.

3

1 48. (original) The system of claim 34 wherein said borehole includes a substantially  
2 non-conducting fluid therein and wherein said resistivity sensor conveys a  
3 measure current into said formation using capacitive coupling.

4

1 49. (original) The system of claim 34 wherein said resistivity sensor further  
2 comprises a shielded dipole.

3

1 50. (original) The system of claim 34 wherein said resistivity sensor further  
2 comprises a directionally sensitive induction logging tool.

3

1 51. (original) The system of claim 50 wherein said directionally sensitive induction  
2 logging tool comprises a quadrupole transmitter.

3

- 1 52. (original) The system of claim 34 wherein said resistivity sensor further  
2 comprises a radio frequency microwave transmitter  
3
- 1 53. (original) The system of claim 34 wherein said resistivity parameter comprises a  
2 resistivity image of said borehole.  
3
- 1 54. (currently amended) A method of determining a parameter of an earth formation  
2 during formation of a borehole in said earth formation by a device on a bottom  
3 hole assembly (BHA), the method comprising:  
4 (a) maintaining a resistivity sensor on said BHA substantially at ~~a specified an~~  
5 offset from a wall of the borehole less than a specified minimum value;  
6 (b) using said resistivity sensor for making measurements indicative of said  
7 parameter during ~~continue~~ continued rotation of said BHA;  
8 (c) using an orientation sensor on said BHA for making a measurement of a  
9 toolface angle of said BHA during said continued rotation; and  
10 (d) using a processor for determining from said measurements said parameter  
11
- 1 55. (original) The method of claim 54 wherein said resistivity sensor comprises a  
2 galvanic sensor.  
3
- 1 56. (original) The method of claim 54 further comprising mounting said resistivity  
2 sensor on a pad.

3

1 57. (original) The method of claim 54 further comprising mounting said resistivity  
2 sensor on a rib of said BHA.

3

1 58 (original) The method of claim 54 further comprising mounting said resistivity  
2 sensor on a stabilizer of said BHA.

3

1 59. (original) The method of claim 54 further comprising  
2 (i) using a current electrode of said resistivity sensor for conveying a measure  
3 current into said formation through a conducting fluid, and  
4 (ii) using at least one guard electrode proximate to said current electrode for  
5 maintaining focusing of said measure current.

6

1 60. (original) The method of claim 59 further comprising using said at least one guard  
2 electrode for focusing said measure current in a direction substantially normal to a  
3 borehole wall.

4

1 61. (original) The method of claim 60 wherein said at least one guard electrode  
2 surrounds said measure electrode and maintains a focusing of said measure  
3 current in a flushed zone of said formation.

4

1 62. (original) The method of claim 59 further comprising using said at least one guard

2 electrode for creating substantially spherical equipotential surfaces

3

1 63. (original) The method of claim 54 further comprising:

2 (i) using a current electrode of said resistivity sensor for conveying a measure  
3 current into said formation,

4 (ii) measuring a voltage of a measure electrode spaced apart from said current  
5 electrode; and

6 (iii) using said processor for determining from a voltage of said measure  
7 electrode and said measure current said resistivity parameter.

8

1 64. (original) The method of claim 60 further comprising using monitor electrodes to  
2 support the focusing in the presence of non negligible contact impedances.

3

1 65. (original) The method of claim 61 further comprising using monitor electrodes to  
2 support the focusing in the presence of non negligible contact impedances.

3

1 66. (currently amended) The method of claim 60 further comprising ~~a-carrying~~  
2 carrying said sensor on a pad that substantially circumscribes said apparatus.

3

1 67. (original) The method of claim 66 further comprising using monitor electrodes to  
2 support the focusing in the presence of non negligible contact impedances.

3

- 1 68. (original) The method of claim 60 further comprising using a processor for  
2 maintaining a substantially constant power consumption by said electrodes.  
3
- 1 69. (original) The method of claim 64 further comprising using a processor for  
2 maintaining a substantially constant power consumption by said electrodes.  
3
- 1 70. (original) The method of claim 66 further comprising using a processor for  
2 maintaining a substantially constant power consumption by said electrodes.  
3
- 1 71. (original) The method of claim 67 further comprising using a processor for  
2 maintaining a substantially constant power consumption by said electrodes.  
3
- 1 72. (original) The method of claim 54 wherein said orientation sensor comprises a  
2 magnetometer.  
3
- 1 73. (original) The method of claim 54 wherein said orientation sensor comprises an  
2 accelerometer.  
3
- 1 74. (original) The method of claim 54 further comprising using a stabilizer for  
2 maintaining said specified offset.  
3
- 1 75. (original) The method of claim 54 further comprising using a steerable rib for

2 maintaining said specified offset.

3

1 76. (original) The method of claim 54 further comprising:

2 (i) using said BHA in a borehole is filled with a substantially nonconducting  
3 fluid, and

4 (ii) capacitively coupling said resistivity sensor to said earth formation.

5

1 77. (original) The method of claim 76 further comprising using said resistivity sensor  
2 for making measurements at a plurality of different frequencies.

3

1 78. (original) The method of claim 76 further comprising using said resistivity sensor  
2 for making measurements at two frequencies.

3

1 79. (original) The method of claim 77 further comprising using said processor for  
2 performing a multi-frequency focusing of said measurements.

3

1 80. (original) The method of claim 54 wherein said borehole includes a substantially  
2 non-conducting fluid therein.

3

1 81. (original) The method of claim 55 further comprising:

2 (i) using said BHA in a borehole is filled with a substantially nonconducting  
3 fluid, and

4 (ii) capacitively coupling said resistivity sensor to said earth formation

5

1 82. (original) The method of claim 54 wherein said resistivity sensor further  
2 comprises a shielded dipole.

3

1 83. (original) The method of claim 80 wherein said resistivity sensor further  
2 comprises a shielded dipole.

3

1 84. (original) The method of claim 80 wherein said resistivity sensor further  
2 comprises a directionally sensitive induction logging tool.

3

1 85. (original) The method of claim 84 wherein said directionally sensitive induction  
2 logging tool comprises a quadrupole transmitter.

3

1 86. (original) The method of claim 80 wherein said resistivity sensor further  
2 comprises a radio frequency microwave transmitter.

3

1 87. (original) The method of claim 54 further comprising using an induction coil as  
2 said resistivity sensor.

3

1 88. (original) The method of claim 87 further comprising using said processor for  
2 determining an inductance of said induction coil.

3

1 89. (original) The method of claim 86 further comprising using said processor for  
2 determining an extent of a fluid invasion of the earth formation.

3

1 90. (original) The method of claim 54 wherein said orientation sensor comprises a  
2 magnetometer

3
